

7.3 Test the Oracle JET web application on different screen sizes

Introduction

A responsive layout adjusts itself to fit different screen sizes across a wide range of devices. When you run your Oracle JET web app in the Google Chrome web browser, you can test the responsiveness of the web app with different screen sizes that you select in the Google Chrome Developer Tools (Chrome DevTools).

Objectives

In this tutorial, you will test the responsive design of the developed Oracle JET web app on different screen sizes.

Prerequisites

- A development environment set up to create Oracle JET web apps that includes an installation of Node.js
- Access to the Oracle JET Developer Cookbook
- Completion of the previous practice 2.2.

Task 1: Run the Web App

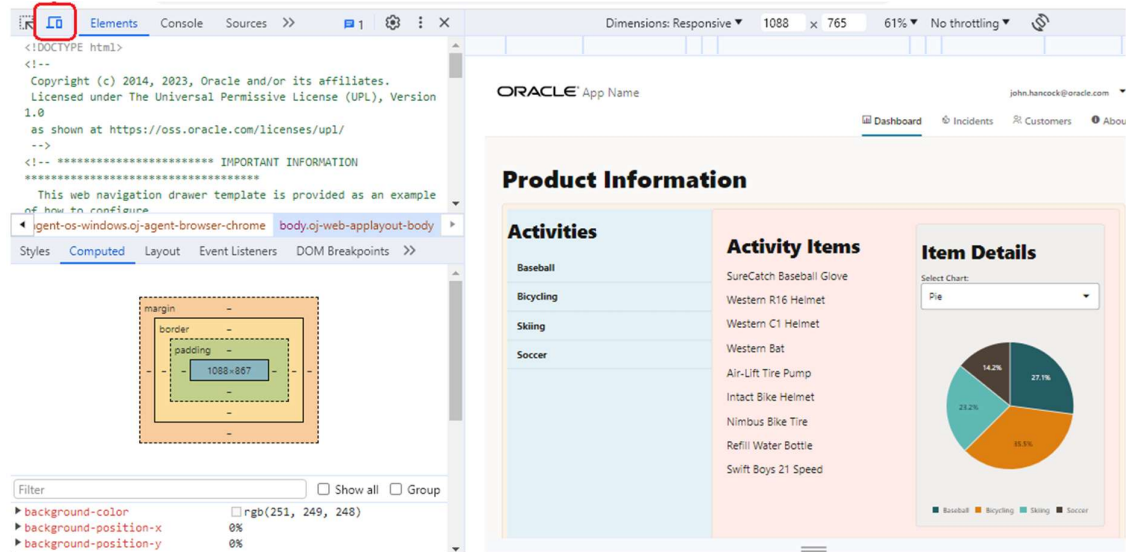

The Oracle JET web app has a responsive layout and components, and it can run on many different web browsers. For this tutorial, we will use the Chrome browser and DevTools to view the app in various screen sizes.

1. In the terminal window, change to the JET_Web_Application directory and run the app.

`npx ojet serve`

Oracle JET tooling runs your web app in Google Chrome.

2. In the Chrome DevTools toolbar, click to switch to the device mode.

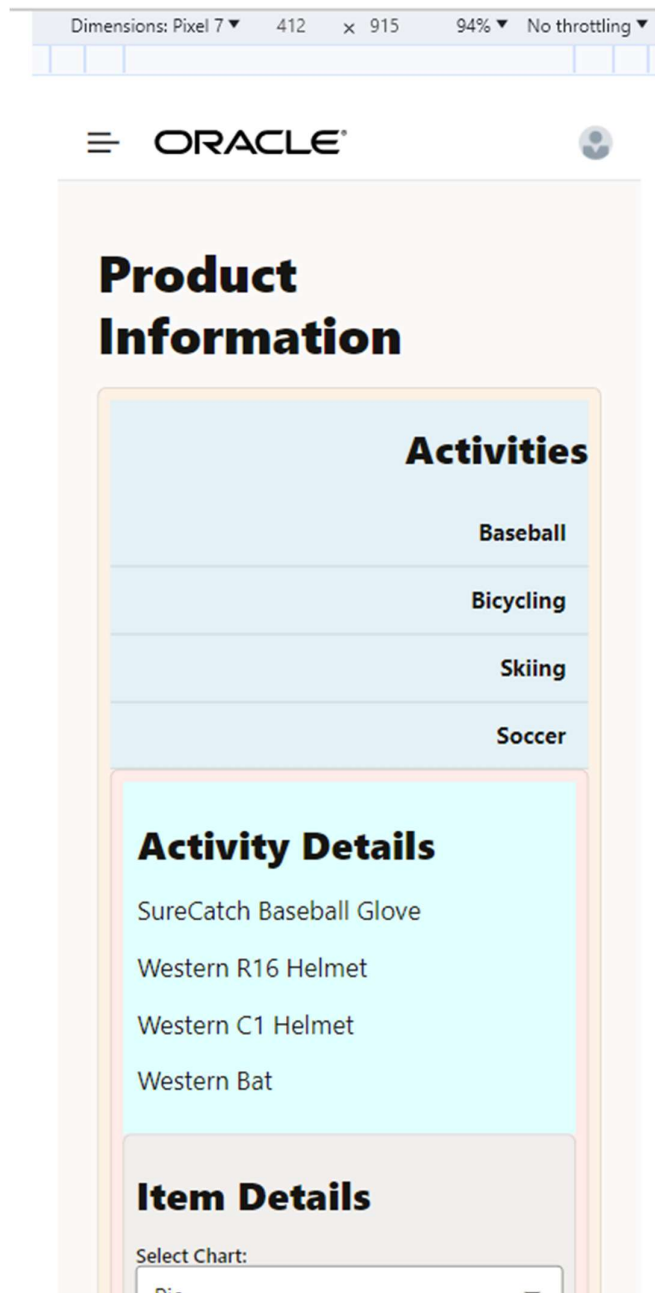

3. From the device mode's screen emulator, select a specific device or screen size to test the app.

4. Select **Pixel 7**.

In the Activities container, the content is aligned to the end of the screen. In the Activity Items container, the list items for small and medium screens are displayed.

You can check this on different screen choices

5. In the Chrome DevTools toolbar, click Toggle device toolbar button to exit the device mode.
