

Activity 2: Understand the Generated Code with AI

Purpose

Learn how to use AI to analyze and understand an existing codebase. Before making changes to any application, developers should understand its structure, functionality, and code flow.

Pre-requisites

- Completion of Activity 1
 - Working EMI Calculator application
 - VS Code with Cline configured
-

Estimated Duration

30–40 Minutes

Scenario

Your Team Lead has asked you to enhance the EMI Calculator in the next sprint. Before implementing new features, you need to understand how the application is structured and how the code works.

Use AI to analyze the generated code and explain its functionality.

Task 1: Understand the Project Structure

Suggested Prompt

Analyze the Oracle JET application currently opened in my workspace.

Provide an overview of:

- The purpose of the application.
- The project structure.
- The important folders and files.
- The role of each major file.
- How the HTML and KnockoutJS ViewModel work together.

Explain everything in simple language suitable for a beginner Oracle JET developer.

Task 2: Understand the HTML View

Suggested Prompt

Analyze the currently opened Oracle JET HTML file.

Explain:

- The purpose of this page.
- The Oracle JET components used.
- How data binding is implemented.
- How user interactions are handled.
- How this page communicates with the KnockoutJS ViewModel.

Do not explain every line of code individually.
Instead, explain the code block by block.

Task 3: Understand the KnockoutJS ViewModel

Suggested Prompt

Analyze the currently opened KnockoutJS ViewModel.

Explain:

- The purpose of this ViewModel.
- The observables used.
- The functions available.
- How the EMI calculation works.
- How the ViewModel updates the user interface.

Use simple language and explain the overall logic rather than every individual statement.

Task 4: Understand the Application Flow

Suggested Prompt

Explain the complete execution flow of this EMI Calculator.

Describe what happens when the user:

1. Enters the Loan Amount.
2. Enters the Interest Rate.
3. Enters the Loan Tenure.
4. Clicks the Calculate EMI button.
5. Views the calculated result.

Present the explanation as a numbered sequence of steps.

Task 5: Review the Code

Suggested Prompt

Review the current Oracle JET application from a code quality perspective.

Evaluate:

- Code readability
- Project organization
- Oracle JET best practices
- KnockoutJS best practices
- Naming conventions
- Opportunities to simplify the code

Provide recommendations only.

Do not modify the existing code.
