

## 1.6. Interacting with Web Elements Using jQuery

### Purpose:

To demonstrate the core concepts of jQuery including:

- jQuery syntax and how it works
- How to use selectors to target elements
- Handling events like click and keyup
- Basic DOM manipulation using .text(), .val(), .toggle(), and more

### Pre-requisites:

- Basic understanding of HTML structure
- Basic knowledge of JavaScript (functions, variables)
- jQuery file included via CDN or locally

### Tasks:

1. Open any text editor (e.g., VS Code)
2. Create a file named jquery-demo.html
3. write the below code:

```
<!DOCTYPE html>
<html>
<head>
  <title>jQuery Practice</title>
  <script src="https://code.jquery.com/jquery-3.6.0.min.js"></script>
</head>
<body>

  <h2 id="title">Welcome to jQuery!</h2>

  <p class="info">This is a paragraph.</p>

  <button id="changeTextBtn">Change Text</button>
  <button class="toggleBtn">Toggle Paragraph</button>

  <input type="text" id="inputBox" placeholder="Type something">
  <button id="getInputBtn">Get Input</button>

  <div id="result"></div>
```

```

</body>

<script>
  // 1. jQuery Syntax + Document Ready
  $(document).ready(function() {
    console.log("jQuery is ready!");

    // 2. jQuery Selector + Event
    $("#changeTextBtn").click(function() {
      $("#title").text("Text changed using jQuery!");
    });

    $(".toggleBtn").click(function() {
      $(".info").toggle(); // Show/Hide paragraph
    });

    // 3. DOM Event Handling (Keyup example)
    $("#inputBox").on("keyup", function() {
      let value = $(this).val();
      $("#result").text("You typed: " + value);
    });

    // 4. DOM Manipulation (Text Input fetch)
    $("#getInputBtn").click(function() {
      let typed = $("#inputBox").val();
      alert("You entered: " + typed);
    });
  });
</script>

</html>

```

4. Save file and open the file in the browser. Also, open the console screen to see when the document gets ready

### **Explanation of the program**

This jQuery demo program shows how to interact with web elements using simple jQuery methods. It begins by ensuring all code runs only after the page is fully loaded. When you click buttons, it changes text or toggles the visibility of a paragraph. As you type in the input box, the text is instantly shown below, and clicking another button shows your typed input in an alert.

Order of operation is :

`$(document).ready()` → Selector → jQuery Method/Action
